

PROFESSIONAL DEVELOPMENT SESSION

Designing AI-Resilient Assessments

How to rethink tasks and assessments so they develop authentic skills in a world where students have access to AI

Module 2.1 • Track 2: AI in the Classroom • xvalidateai.com

Audience
K–12 Teachers

Format
Workshop

Duration
75 minutes

Level
Intermediate

Class Size
**8–30
participants**

Session Overview

This workshop addresses one of the most urgent challenges in education today: student access to AI tools has fundamentally changed what a “completed task” means. Rather than responding with blanket bans or detection-first strategies, this session gives teachers a practical, research-informed framework for redesigning assessments that remain meaningful, rigorous, and authentic — regardless of AI availability.

Participants leave with a redesigned version of one of their own assessments and a transferable framework they can apply across subjects and grade levels.

Learning Objectives

By the end of this session, participants will be able to:

- 1 Explain why traditional assessment designs are vulnerable to AI completion — and what makes an assessment “AI-resilient” vs. “AI-proof” (and why the latter is neither possible nor desirable)
- 2 Apply the PACT Framework to evaluate the AI-vulnerability of any existing assessment task
- 3 Redesign at least one of their own assessments using one or more of the five AI-resilient design strategies
- 4 Draft a transparent AI use statement for a unit or course that sets clear student expectations
- 5 Articulate a professional stance on AI in student work that is grounded in learning goals, not just compliance

Key Concepts & Framing

The Core Problem

When a student submits a piece of work, we are making an inference: that the work represents their thinking, knowledge, or skill. AI tools introduce a gap between the work submitted and the thinking that produced it. The question is not “how do we stop students from using AI?” — it is “how do we design tasks where the learning process itself is what we are assessing?”

AI-Resilient vs. AI-Proof

An AI-proof assessment tries to block AI use entirely. These approaches are largely futile, often inequitable, and treat the symptom not the cause. An AI-resilient assessment is designed so that completing it meaningfully requires genuine engagement — AI may be involved, but doing the task well still demands real learning, thinking, and effort from the student.

The PACT Framework

A four-lens diagnostic tool for evaluating any assessment’s AI-vulnerability. Each lens surfaces a different risk:

P — Process visibility

Can we see how the student arrived at their answer, or only the final product? AI can produce polished products but not authentic reasoning trails.

A — Adaptability

Can the task be completed without any context about this student’s specific situation, class, community, or experience? Generic tasks = high AI-vulnerability.

C — Cognitive depth

What level of Bloom’s Taxonomy does the task require? AI handles recall, summary, and surface-level analysis well. Evaluation, synthesis, and creation from personal context are harder.

T — Time & conditions

Does the task happen under conditions where AI access is controlled, or is it fully unsupervised? Does the timeline require real-time thinking and iteration?

Five AI-Resilient Design Strategies

Participants will work with these five strategies during the workshop activities:

1. Personalize the context

Anchor the task to the student’s own experience, classroom, school, or community. AI cannot fabricate authentic personal knowledge.

2. Make process visible

Assess drafts, annotations, think-alouds, or in-class discussions rather than only final products.

3. Require real-time demonstration

Include oral defenses, live presentations, in-class written components, or Socratic questioning after the main task.

4. Elevate cognitive level

Move from “describe” to “evaluate” and “create.” Ask students to take a position, make a judgment, or apply knowledge to a novel and specific case.

5. Embrace AI as a tool — explicitly

Design tasks where AI use is transparent, documented, and assessed as part of the work. Scaffold AI literacy into the task itself.

Session Agenda (75 minutes)

Time	Activity	Format	Materials
0–5 min	Welcome & framing: the gap between work submitted and learning achieved	Facilitator mini-lecture	Slide deck
5–15 min	Opening provocation: “Would AI pass this?” — participants rate 3 sample assessments	Individual + pair share	Sample assessment cards
15–25 min	Introduction to the PACT Framework with worked examples from multiple subjects	Facilitator input + guided notes	PACT one-pager
25–40 min	Activity 1: PACT Audit — participants apply the framework to one of their own current assessments	Individual then small group	PACT audit worksheet
40–58 min	Activity 2: Redesign Sprint — participants select and apply 1–2 design strategies to redesign their audited assessment	Structured individual work	Strategy menu, redesign template
58–68 min	Gallery walk — pairs share redesigns; peers leave sticky note feedback	Pairs + whole group	Wall space / sticky notes
68–73 min	Debrief: What strategies felt most transferable? What tensions came up?	Whole group discussion	—
73–75 min	Wrap-up: AI use statement template & next steps	Facilitator close	AI use statement template

Activities — Facilitator Guide

A1 Opening Provocation: “Would AI Pass This?”

10 minutes

Participants work individually then in pairs to rate three pre-prepared sample assessments on a simple 1–5 scale: “How easily could AI complete this task in a way that would score well?” The goal is not to get a ‘correct’ answer but to surface existing intuitions before introducing the framework.

1. Distribute the three sample assessment cards (one per subject area: humanities, STEM, and elective/arts).
2. Participants rate each assessment 1–5 individually (1 = AI would struggle, 5 = AI would ace this easily) and jot a one-sentence rationale.

3. Pairs compare ratings and note where they agree or disagree — disagreements are the most valuable.
4. Facilitator cold-calls 2–3 pairs. Surface the key tension: we often equate “hard to do” with “AI-resilient” — but rigor and AI-resilience are not the same thing.

A2 PACT Audit — Apply the Framework to Your Own Assessment

15 minutes

Each participant audits one of their own current assessments using the PACT worksheet. This is the diagnostic phase: the goal is honest identification of vulnerability, not judgment about the teacher’s existing practice.

5. Participants bring (or choose on the spot) one assessment they currently use — any type, any subject.
6. Using the PACT one-pager as a reference, they complete the four-lens audit worksheet (5 min solo).
7. In groups of 3, each person shares their highest-risk lens and one question they’re sitting with (7 min).
8. Facilitator pause: ask “Who found a lens that surprised them?” Take 2–3 responses and link back to the framework.
9. Participants circle the lens they want to address in the redesign sprint.

A3 Redesign Sprint — Apply One or Two Design Strategies

18 minutes

Using the five-strategy menu and redesign template, each participant makes concrete revisions to their audited assessment. This is intentionally limited in scope — one meaningful change is better than a theoretical overhaul. Encourage specificity over completeness.

10. Distribute the Strategy Menu card and the Redesign Template. Participants select 1–2 strategies most relevant to the lens they circled in A2.
11. Work time: 12 minutes of focused individual writing. Facilitator circulates and asks probing questions: “What would a student need to know that AI couldn’t?” “Where in this task does the learning actually happen?”
12. At 12 minutes, participants pair up and each person reads their original task and their revision aloud (30 seconds each).
13. Partner responds with one observation using the sentence stem: “This redesign requires the student to... whereas the original didn’t necessarily.”

Facilitation Notes & Common Scenarios

Anticipated Participant Reactions

“But students will just use AI for the personal parts too.”

Acknowledge this is possible. Redirect: our goal is not to create perfect barriers but to shift what is being assessed. When a student fabricates a personal connection, that fabrication itself becomes assessable. And in-class components (strategy 3) address the verification concern.

“This feels like it’s just making more work for teachers.”

Validate the concern. Point out that many redesigns are structural changes, not additions. A task that requires a 5-minute in-class oral check-in on a take-home project often takes less grading time overall than re-marking suspected AI submissions.

“Our school has an AI detection policy — shouldn’t we just use that?”

Respect institutional context. Add: AI detection tools have significant false-positive rates and have disproportionately flagged ELL students. Assessment redesign reduces the need for detection rather than competing with it.

“What about standardized tests? We can’t control those.”

Agree: this framework applies to teacher-designed assessments, not standardized testing. Refocus on the considerable portion of assessment that is within teacher control.

Differentiation for Participant Experience Levels

Less experienced with AI	More experienced with AI
• Pair with a more experienced colleague during A3 • Provide the ‘pre-rated’ sample assessments so the provocation is accessible • Focus on one strategy only in the redesign sprint • Offer a ‘starter’ version of the redesign template with sentence frames	• Redesign a more complex multi-part assessment • Apply all four PACT lenses rather than selecting one • Draft a full AI use statement during the sprint • Serve as a resource partner during the gallery walk

Participant Handouts — Content

Handout 1: The PACT Framework — Quick Reference

Lens	Diagnostic question	High-vulnerability signal	Primary strategies
P — Process visibility	Can I see how the student thought, not just what they concluded?	Take-home, product-only, no drafts required	Strategy 2, 3
A — Adaptability	Does this task require anything specific to this student’s life or context?	Generic prompt, no personal anchor needed	Strategy 1
C — Cognitive depth	What Bloom’s level does this require? Could AI hit that level?	Recall, summary, description, basic analysis	Strategy 4
T — Time & conditions	Does any part of this happen under conditions where thinking is witnessed?	Fully unsupervised, unlimited time, no check-in	Strategy 3, 5

Handout 2: Assessment Redesign Template

My original task (brief description)	
Subject / Grade level	
PACT lens I am targeting	P A C T (circle one)
Strategy/ies I am applying	1 2 3 4 5 (circle one or two)
Specific change I am making	
What the student still needs to do that AI cannot do for them	
What I will look for in grading that demonstrates real learning	
One thing I'm still uncertain about	

Handout 3: AI Use Statement Template

NOTE

The following template can be adapted for a single assignment, a unit, or a full course. The goal is transparency and shared expectations — not a legal document.

AI Use Statement — [Class / Assignment Name]

In this [class / unit / assignment], my goal is for you to [describe the core learning goal]. To demonstrate that learning, I need to be able to see your thinking, not just a finished product.

What you may use AI for in this assignment:

- [e.g., Generating an initial outline to react to and revise]
- [e.g., Checking grammar and sentence clarity on your final draft]

What you may not use AI for:

- [e.g., Writing the sections of the assignment that ask for your personal experience or position]
- [e.g., Completing the in-class component]

If you use AI for any permitted purpose, you must:

- Attach an AI use log at the end of your submission (prompts used, tool used, what you changed from the AI output)
- Be prepared to discuss your work and reasoning in class

If you are unsure whether a specific use is permitted, ask me before you submit.

Materials & Preparation Checklist

Item	Details	Quantity
Slide deck	Session slides with PACT framework visual, activity prompts, and timer	1 (digital)
Sample assessment cards	3 laminated or printed cards: one humanities, one STEM, one elective. Pre-selected to represent a range of AI-vulnerability.	1 set per participant
PACT one-pager (Handout 1)	Full-colour printed quick-reference	1 per participant
Redesign template (Handout 2)	Single page, print double-sided with space to write	1 per participant
AI use statement template (Handout 3)	Print or share digitally via QR code	1 per participant
Strategy menu card	Laminated card with the five strategies, one sentence each, with a one-line example	1 per participant
Sticky notes (2 colours)	For gallery walk feedback — one colour for 'strength', one for 'question'	10 per participant
Wall/display space	For gallery walk redesigns — participants post their redesign template	Enough for full group

Assessment of Participant Learning & Follow-Through

In-session evidence of learning

- PACT audit worksheet completed with at least two lenses addressed
- Redesign template completed with a specific, concrete change (not a vague intention)
- Gallery walk participation: minimum one sticky note left for a peer

30-day follow-through options (choose one)

Implement: Use the redesigned assessment with a real class in the next 30 days and bring a brief note on what happened to the next PD session.

Share: Share the redesigned assessment with one colleague and discuss it with them.

Extend: Apply the PACT framework to two more of your assessments and bring the completed worksheets to your next coaching check-in.

Write: Draft AI use statements for two different units and submit them for inclusion in the school's assessment policy review.

Connection to xvalidateai.com platform

Completed PACT audit worksheets and redesigned assessment templates can be uploaded to the school's xvalidateai dashboard as evidence of teacher professional development in AI governance. Facilitators can log session completion and participant engagement as part of the school's AI readiness record.

TIP

This session works especially well when delivered as part of a department-level PD day, so teachers can redesign assessments from shared units and collaborate during the sprint activity.
