

PROFESSIONAL DEVELOPMENT SESSION

Teaching Students to Use AI Responsibly

Classroom-ready frameworks for modelling responsible AI use, building students’ critical thinking skills, and setting clear expectations that hold — across every grade level

Module 2.2 • Track 2: AI in the Classroom • xvalidateai.com

Audience K–12 Teachers	Format Workshop	Duration 90 minutes	Level Intermediate	Grade span K–12 adaptations
----------------------------------	---------------------------	-------------------------------	------------------------------	---------------------------------------

Session Overview

Students are already using AI — whether teachers know it or not. The question is no longer whether to address AI use in the classroom, but how to equip students with the skills, habits, and values to use it well. This workshop gives teachers the frameworks, language, and classroom-ready tools to teach responsible AI use explicitly, rather than hoping students figure it out on their own.

This is not a session about detection or enforcement. It is about teaching — about developing in students the critical thinking, ethical reasoning, and self-awareness that responsible AI use requires. The approaches here are grounded in digital citizenship frameworks, academic integrity research, and what we know about how young people actually engage with new technologies.

The session includes differentiated materials for elementary, middle, and high school contexts, so teachers leave with tools they can use with their actual students — not adapted abstractions.

Learning Objectives

By the end of this session, participants will be able to:

1	Articulate a clear, age-appropriate rationale for teaching responsible AI use — one they can communicate confidently to students, families, and colleagues
2	Apply the THINK–USE–REFLECT framework to design and deliver explicit instruction in responsible AI use
3	Facilitate at least two of the five classroom activities included in this module with their own students
4	Write a classroom AI agreement collaboratively with students, appropriate to their grade level
5	Respond confidently to the most common student challenges and misconceptions about AI use

6

Adapt any element of this session for elementary, middle school, or high school contexts

Key Concepts & Framing

Why This Requires Explicit Teaching

Students do not automatically know what responsible AI use looks like. They know how to use the tools — but without explicit guidance, many operate on a spectrum from total avoidance (out of fear) to uncritical reliance (out of efficiency). Neither serves their learning. Responsible AI use is a skill set, not a default.

The research on digital literacy is clear: students develop better judgment about technology when adults name the skills explicitly, create structured opportunities to practise them, and model the reasoning themselves. The same principles apply to AI literacy.

The Responsibility Spectrum

A useful framing for students at any grade level is the Responsibility Spectrum — a continuum from Avoidance on one end to Uncritical Reliance on the other, with Intentional Partnership in the middle. The goal is not to position AI as good or bad, but to help students understand that how they use it is a choice with real consequences for their learning.

Avoidance	Intentional Partnership	Uncritical Reliance
Refuses to engage with AI out of fear, confusion, or a belief that it's always wrong to use it <i>Learning gap: misses out on developing skills they will need</i>	Uses AI deliberately, with a clear purpose, evaluates what it produces, and remains the thinking agent <i>Learning outcome: develops judgment, AI literacy, and critical thinking alongside subject knowledge</i>	Accepts AI output without questioning accuracy, bias, or fit; lets AI do the thinking <i>Learning gap: does the work but not the learning; develops a dependence that weakens critical skills</i>

The THINK–USE–REFLECT Framework

A simple three-stage framework for structuring student AI interactions. It can be taught explicitly as a process, embedded in task instructions, or used as a reflection tool after the fact. It works at every grade level and across subjects.

THINK (before)	Before opening an AI tool, students define what they actually need. What is the task? What do I already know? What do I want AI to help with — and what must I do myself? This stage interrupts the reflex to outsource thinking immediately.
USE (during)	While using AI, students engage actively rather than passively. They ask follow-up questions, push back on outputs, compare AI responses to their own thinking, and stay in the role of the critical evaluator — not the passive receiver.

REFLECT (after)

After using AI, students evaluate what they got. Was it accurate? Was it useful? Did it help me understand, or just give me something to submit? What did I change, and why? What did I actually learn through this process?

KEY

The THINK–USE–REFLECT framework is most powerful when it is made visible — when teachers model it out loud, when students submit a brief reflection log alongside AI-assisted work, and when it becomes a shared classroom language rather than a one-time lesson.

Five Principles of Responsible Student AI Use

These five principles form the conceptual backbone of the student-facing content. They are written to be taught, discussed, and displayed — not just distributed in a policy document.

- 1. You are always the author.**
AI can assist, suggest, and generate — but you are responsible for everything you submit. Your name is on it. Your judgment goes into it. AI does not get the credit; you do not get to escape the responsibility.
- 2. Understanding is the goal, not completion.**
If AI does the thinking and you submit the result, you may have completed the task but you have not learned. Ask yourself: do I actually understand this now? Could I explain it to someone without looking at the AI output?
- 3. AI is not a neutral source.**
AI systems reflect the data they were trained on — which means they can be wrong, biased, culturally narrow, or confidently incorrect. Every output needs critical evaluation, just like any other source.
- 4. Transparency is integrity.**
Hiding AI use when it is not permitted, or pretending AI-generated content is your own original work, is dishonest. When in doubt, disclose. The conversation you avoid is often more damaging than the one you have.
- 5. Your skills are worth developing.**
AI gets better every year. The skills that matter most are the ones AI cannot replace: judgment, creativity, empathy, ethical reasoning, and the ability to communicate authentically. These are developed by doing the hard work — not by outsourcing it.

Grade-Level Adaptations

Every element of this module can be adapted for K–12. The table below shows how the core concepts translate across grade bands. Teachers should use this to calibrate language, examples, and activity complexity for their own students.

Aspect	Elementary (K–5)	Middle School (6–8)	High School (9–12)
Core framing	AI as a tool, like a calculator — useful for some things, not for others; we still need to think	AI as a powerful assistant that needs direction and checking — it works for you, not instead of you	AI as a collaborator with known limitations — useful when used with intention, judgment, and transparency

THINK stage	Pause and ask: What am I trying to do? Can I try this myself first?	Define the task and your own role in it before opening the tool	Set a clear purpose and constraints before engaging AI; plan what you will and will not outsource
USE stage	Try the task yourself first; use AI to check, not replace	Engage critically during AI interaction; challenge outputs that seem off	Use AI as a sounding board; compare its reasoning to your own; iterate and interrogate
REFLECT stage	Simple: Did AI help me learn, or just give me an answer?	Two-question journal: What did I change? What do I understand now that I didn't before?	Full reflection log: purpose, process, evaluation, learning, and one question the AI raised that I need to investigate further
Classroom agreement	Co-created class rules with pictures/icons; displayed prominently	Student-authored norms with examples of what each looks like in practice	Student-led policy document; may include scenario-based examples and a statement on academic integrity
Key vocabulary	Tool, check, my idea, AI idea	Accuracy, bias, source, evaluate, disclose	Transparency, academic integrity, critical evaluation, attribution, intellectual ownership

Workshop Agenda (90 minutes)

Time	Segment	Activity	Format	Materials
0–8 min	Welcome & framing	Opening provocation: 'What would you want your students to know about AI by the end of this year?' Pair share, then whole group	Pair share	Slides
8–20 min	The landscape	Where do students actually encounter AI? Brief survey + discussion. Introduce the Responsibility Spectrum.	Survey + discussion	Spectrum poster
20–35 min	THINK–USE–REFLECT	Introduce the framework with a modelled example. Participants annotate a sample student scenario using the three stages.	Input + annotation	Framework card, scenario sheet
35–50 min	Five principles	Each principle introduced with a student-facing scenario. Small groups discuss: how would you teach this to your class? What language would you use?	Small group	Principles card
50–68 min	Classroom activity workshop	Participants choose two activities from the menu and work through them: read the activity, adapt it for their	Pairs / trios	Activity cards

		grade level, write one discussion question		
68–78 min	Classroom AI agreement	Participants draft the first version of a classroom AI agreement for their own class, using the template and grade-level guidance	Individual work	Agreement template
78–86 min	Share & refine	Small groups share draft agreements; peers give one suggestion using the sentence stem: 'You might also consider...'	Small group	—
86–90 min	Wrap-up & next steps	Modelling protocol, student scenario cards, 30-day commitment	Facilitator close	All handouts

Classroom Activities — Full Guide

The following five activities are designed to be used directly with students, not just discussed in the PD session. Each includes grade-level adaptation notes. During the workshop, teachers work through two activities as participants, then plan how to use them with their own classes.

CA1	The AI or Me? Sorting Activity Audience: All grades	20–25 min
<i>Students receive a list of 15 tasks and sort them into three categories: Tasks I should do myself, Tasks where AI is a useful partner, and Tasks AI should not replace my thinking on. The sorting generates rich discussion about why the categories are not always obvious — and that the answer often depends on context and learning goal.</i> 1. Preparation: print or display the 15-task list (provided in Handout 2). Tasks include: writing a personal narrative, generating synonyms, summarising a chapter, forming an opinion on a local issue, calculating statistics, checking grammar, researching a historical event, designing an experiment, evaluating an argument, translating a phrase, generating ideas for a story, writing a lab report conclusion, preparing for a class debate, creating a study guide, and reflecting on your own learning. 2. Students work individually first (3 min), sorting tasks into three columns on the provided sheet. 3. Small group discussion (7 min): compare sorts. Where do you agree? Where do you disagree? What made the 'it depends' cases hard? 4. Whole class debrief (8–10 min): facilitator surfaces the key insight — the same task can be in different categories depending on what you are trying to learn. A synonym generator is fine for professional writing; it may deprive you of vocabulary practice in an English lesson. 5. Grade adaptation — Elementary: reduce to 8 tasks; use pictures or icons alongside text; anchor in familiar classroom activities. Middle: use the full 15; add a fourth column 'It depends — on what?'. High School: add a fifth column 'What would I lose if AI did this?'		
CA2	The Accuracy Audit Audience: Middle / High School	25–30 min

Students use an AI tool to generate an answer or explanation on a topic they are currently studying, then fact-check it against two other reliable sources. They annotate the output, marking what is accurate, what is inaccurate, and what is missing. The goal is to develop the habit of critical evaluation as a reflex, not an afterthought.

6. Choose a topic from the current unit that students know enough about to evaluate. Ask the AI a specific question about that topic.
7. Students print or screenshot the AI output and annotate it in three colours or symbols: green tick (accurate), red cross (inaccurate or misleading), question mark (unable to verify or missing context).
8. Students write a two-sentence summary: 'Overall, this output was [reliable / partially reliable / unreliable] because...'
9. Class discussion: What did you find? What surprised you? What would have happened if you had submitted this without checking?
10. Extension: Students compare the same question asked to two different AI tools. Are the errors the same or different? What does that tell you?
11. Grade adaptation: Elementary version uses a simpler AI summary of a familiar topic (e.g., a well-known animal). Provide a simple true/false checklist rather than open annotation.

CA3 The Transparency Conversation

Audience: All grades

20 min

A structured class discussion about when and how to disclose AI use. Students explore three real-world scenarios in small groups and decide what they would do and why. The goal is to build a shared vocabulary around transparency and to surface the values behind the rules — not just the rules themselves.

12. Introduce the discussion with a framing question: 'If you used AI to help with something, when would you tell someone, and when wouldn't you? Why?' Brief pair share.
13. Distribute the three scenario cards (below) — one per group. Each group reads their scenario, discusses the two questions on the card, and prepares a 60-second share-back.
14. Groups share back. Facilitator records the reasons for and against disclosure on the board.
15. Class synthesis: What patterns do you notice? When does disclosure matter most? Arrive at a class principle together: something like 'We disclose when the purpose of the task is to show our own thinking' or similar.
16. Grade adaptation — Elementary: use only one scenario, whole-class, with the teacher modelling the discussion. Middle: all three scenarios. High School: add a fourth scenario where the line is genuinely ambiguous.

Scenario Cards for CA3: The Transparency Conversation

Scenario A: The essay helper — Middle / High School

17. Jordan used an AI chatbot to help brainstorm ideas for a history essay. The AI gave five ideas. Jordan kept two, changed one, and came up with three original ones. The final essay is mostly Jordan's own writing, but those two AI ideas shaped the direction of the argument. The teacher hasn't asked about AI use.
18. Should Jordan disclose? What would you do?

19. Does it matter how much of the essay came from AI vs. Jordan's own thinking?

Scenario B: The grammar check — Elementary / Middle

20. Priya used an AI tool to check her story for grammar mistakes after she finished writing it. The AI corrected punctuation and changed a few sentences to make them flow better. Priya accepted some of the changes and rejected others. The story itself is completely her own.
21. Is this different from Jordan's situation? Why or why not?
22. Would your answer change if the assignment was specifically about practising punctuation?

Scenario C: The research summary — High School

23. Marcus needed to understand a complex scientific concept for a class discussion. He asked AI to explain it in simple terms, which helped him understand it. He then participated confidently in the discussion using that understanding — but did not mention that he'd used AI to prepare.
24. Did Marcus do anything wrong?
25. How is this different from reading a textbook or watching a YouTube explainer?

CA4	The THINK–USE–REFLECT Log	Ongoing
	Audience: All grades	
<i>A structured one-page reflection log that students complete alongside any AI-assisted work. Used consistently, it builds the metacognitive habit of intentional AI use. It can be submitted with the assignment, used as a class discussion starter, or kept in a learning journal. The format differs by grade level.</i> 26. Introduce the log by modelling it yourself: project a task you are doing and think aloud through each stage. 27. Explain the purpose: this is not a gotcha — it is a record of your thinking process. You will not lose marks for using AI. You may lose marks if your reflection shows you did not actually engage with the task. 28. Students complete the appropriate version of the log (elementary, middle, or high school — see Handout 3) alongside their next AI-assisted task. 29. After the first use, hold a brief class reflection: What was useful about doing the log? What was uncomfortable? Why? 30. Over time, the log can be simplified as the THINK–USE–REFLECT process becomes habitual. The goal is to internalise the habit, not to maintain the paperwork indefinitely.		
CA5	Building the Classroom AI Agreement	30–40 min
	Audience: All grades	
<i>A collaborative process for developing a shared class agreement about AI use. Unlike a policy handed down from above, this agreement is written by students — with teacher facilitation — and reflects their values, their learning goals, and their understanding of the issues. Agreements built this way have far higher buy-in and are more likely to shape actual behaviour.</i>		

31. Opening discussion (5 min): What do you think makes AI use fair in this class? Collect ideas on the board without judging.
32. Small group work (10 min): Each group takes one of the Five Principles and discusses: What does this look like in our class? What would following it mean day-to-day? What would violating it look like?
33. Groups share back (8 min). Facilitator synthesises into 4–6 draft agreement statements on the board.
34. Whole class refines (7 min): Does everyone understand what each statement means? Are there any that feel unfair, unclear, or missing? Students suggest amendments.
35. Final agreement (5 min): Class agrees on the final version. Teacher types it up, students sign or initial a copy, and it is displayed in the classroom and/or on the class learning platform.
36. Revisit at least once per term: Is the agreement still working? Does anything need to change given what we've learned about AI since we wrote it?
37. Grade adaptation — Elementary: teacher-facilitated, whole class, with pictures and simple language. Agreement has 3–4 statements maximum. Middle: small group process as described. High School: student-led — teacher is a resource and final approver, not the driver.

Teacher Modelling Protocol

One of the most powerful things a teacher can do is model responsible AI use out loud in front of students. This is not about demonstrating AI tools — it is about making the thinking process visible: how you decide whether to use AI, how you evaluate what it gives you, and how you decide what to keep, change, or discard.

WHY IT MATTERS

Research on cognitive apprenticeship consistently shows that students develop skills faster when they can observe expert thinking made explicit. When a teacher says 'I'm going to think aloud while I use this tool' and then narrates their evaluation process, they are demonstrating the skill, not just describing it.

A Five-Step Modelling Protocol

Step 1: Announce your purpose

Tell students exactly what you are trying to accomplish and why you are considering using AI for it. "I need to find five examples of figurative language for our lesson. I'm going to ask AI to generate some ideas and then I'll evaluate them."

Step 2: Show the THINK stage

Before prompting, say what you already know and what you want AI to contribute. "I already know what figurative language is and I have two examples in mind. I want AI to give me a broader range, including some I might not have thought of."

Step 3: Think aloud during USE

As the output appears, narrate your evaluation. "That one's a good example — clear and grade-appropriate. That one is technically correct but too obscure for this class. This one I'm not sure about — let me check whether it's genuinely figurative or just informal language."

Step 4: Make explicit decisions

Show the choices you make. “I’m keeping three of the five suggestions, rejecting one because it’s inaccurate, and adapting one to better fit our context.”

Step 5: Name the REFLECT stage

“Was AI useful here? Yes — it gave me options faster than I’d generate them alone. Did I learn anything? I found a new example I hadn’t considered. Did it do my thinking for me? No — I still had to evaluate every one.”

TIP

You do not need to model perfectly. Showing students that you sometimes reject AI output, that you catch mistakes, and that you sometimes close the tool and go back to your own thinking is more powerful than a polished demonstration where everything works first time.

Participant Handouts — Content

Handout 1: THINK–USE–REFLECT — Classroom Poster & Student Card

FORMAT

Designed as: (A) an A3 classroom poster, and (B) a quarter-page student card they keep. Both versions are included in this handout. The poster uses large, visual format; the card is text-only for quick reference.

Stage	Questions to ask yourself	Red flag if...
THINK (before you use AI)	What is this task actually asking me to do? What do I already know? What do I need to find out? Is AI the right tool for this? What part am I going to do myself, no matter what?	<i>You open AI before you’ve thought about the task at all. You’re using AI because you don’t want to try.</i>
USE (while using AI)	Am I asking clear questions? Is this output actually accurate? Does this make sense to me? Would I be able to explain this in my own words? Is AI helping me think, or thinking for me?	<i>You copy the first thing AI says without reading it carefully. You feel like you’re watching, not participating.</i>
REFLECT (after using AI)	Did AI help me understand, or just complete the task? What did I change, and why? What do I know now that I didn’t before? Would I be able to do a similar task better next time?	<i>You couldn’t explain what you submitted if someone asked you. You feel vaguely guilty about the work.</i>

Handout 2: AI or Me? Sorting Activity — Student Task Sheet

Instructions: For each of the tasks below, decide which column it belongs in. Remember: your answer may depend on the context — what you are trying to learn, what the assignment is asking for, and what skills you are building. Be ready to explain your reasoning.

Task	I should do this myself	AI can be a useful partner	It depends — on what?
------	-------------------------	----------------------------	-----------------------

Writing a personal narrative about your own experience	☐	☐	☐
Generating synonyms for a word	☐	☐	☐
Summarising a chapter from a textbook	☐	☐	☐
Forming an opinion on a local community issue	☐	☐	☐
Calculating statistical data for a science project	☐	☐	☐
Checking grammar in a finished piece of writing	☐	☐	☐
Researching a historical event	☐	☐	☐
Designing a science experiment	☐	☐	☐
Evaluating the strength of an argument	☐	☐	☐
Translating a phrase into another language	☐	☐	☐
Generating ideas for a creative story	☐	☐	☐
Writing the conclusion of a lab report	☐	☐	☐
Preparing talking points for a class debate	☐	☐	☐
Creating a revision study guide	☐	☐	☐
Reflecting on your own learning over a term	☐	☐	☐

Handout 3: THINK–USE–REFLECT Student Log — All Grade Versions

NOTE

Three versions are provided below: Elementary (simple, visual-friendly), Middle School (structured prompts), and High School (full metacognitive log). Use the version appropriate for your students, or allow students to choose.

Elementary Version (K–5)

My name: _____ Task: _____ Date: _____

THINK: Before I used AI, I already knew...

USE: I asked AI to help me with...

REFLECT: After using AI, I...

- ☐ learned something new
- ☐ changed some of what AI gave me

☐ could explain this work to my teacher

Middle School Version (6–8)

Name: _____ Assignment: _____ AI tool used: _____

THINK — Before I started:

What I already knew about this topic: _____

What I decided to use AI for (and what I decided to do myself): _____

USE — While I was using AI:

One thing I changed or rejected from the AI output, and why: _____

One thing I wasn't sure about and had to check: _____

REFLECT — After I finished:

Do I understand this work well enough to explain it? ☐ Yes ☐ Mostly ☐ Not yet

One thing I learned that I didn't know before this task: _____

High School Version (9–12)

Name: _____ Assignment: _____ AI tool(s) used: _____

Date: _____

THINK — Before engaging AI

Purpose: What was I trying to accomplish, and why did I decide AI might help?

Scope: What did I commit to doing myself, regardless of what AI produced?

USE — During the interaction

Evaluation: What did I find inaccurate, incomplete, or unsuitable in the AI output?

Decisions: What did I keep, change, or discard, and on what basis?

REFLECT — After completing the work

Learning: What do I understand now that I did not before? Could I do a similar task without AI?

Open question: What question did this process raise that I still need to investigate?

Integrity statement: The work I am submitting is the result of my own judgment, with AI assistance as described above. Signature: _____

Handout 4: Classroom AI Agreement — Template

FORMAT

This template is used as the starting point for CA5. The teacher completes the header, then students collaboratively fill in the agreement statements during the activity. Final version is displayed in the classroom and shared with students digitally.

Our Class AI Agreement

Class: _____ Teacher: _____ Date agreed: _____

We agree that the goal of using AI in this class is to support our learning — not to replace our thinking.

We commit to:

1.

2.

3.

4.

We agree that these things are not acceptable:

1.

2.

When we are unsure, we will:

We will revisit this agreement on: _____

Signed by the class: _____

Materials & Preparation Checklist

Item	Description	When needed
Workshop slide deck	Session slides including the Responsibility Spectrum visual, THINK–USE–REFLECT diagram, activity instructions, and timers	Before session
Responsibility Spectrum poster	A3 printed poster for display during the opening segment. Can also be shown digitally.	Before session
THINK–USE–REFLECT card (H1)	Printed for each participant. Ideally laminated. The classroom poster version is also useful for display during the session.	Before session
AI or Me? task sheet (H2)	Printed single page per participant. Used in CA1.	Before session

Reflection log — all three versions (H3)	Print one of each version for each participant, so they can see all three and select the right one for their class.	Before session
Classroom AI Agreement template (H4)	Printed single page per participant.	Before session
Scenario cards (CA3)	Scenarios A, B, and C printed on card stock or half-sheets. One set per three participants.	Before session
Activity cards	One card per activity (CA1–CA5) summarising the activity for participants. Used during the activity workshop section.	Before session
Sticky notes	For agreement drafting and peer feedback in CA5. Two colours: one for suggestions, one for strengths.	During session
30-day commitment card	Small card with three follow-through options. Print one per participant.	End of session

Facilitation Notes & Common Scenarios

Setting the Right Tone

The single most important facilitation decision for this session is tone. Teachers arrive with a wide range of feelings about AI — enthusiasm, anxiety, frustration, and everything in between. The opening must establish that this session is not about surveillance, detection, or penalising students. It is about teaching. Once that is clear, the room becomes much more generative.

Avoid framing AI as a threat that must be contained. Frame it as a reality that must be navigated — with students, not against them.

Anticipated Participant Reactions

“Students are just going to use AI to cheat no matter what we do.”

Acknowledge the frustration directly. Redirect to what is within teacher control: the quality of the task, the learning environment, and the explicit instruction in values and skills. Some students will always try to cheat — with AI or without it. Our goal is to build the majority who genuinely engage. The THINK–USE–REFLECT framework and the classroom agreement are tools for building that culture over time, not overnight fixes.

“My students are too young for this conversation.”

Elementary students are already encountering AI in apps, games, and voice assistants. They are not too young for age-appropriate conversations about what tools do and don't do, and about the difference between doing something yourself and having a machine do it. The grade-level adaptations in this session are specifically designed for K–5. Simple language, concrete examples, and teacher-modelled conversations are entirely accessible at primary level.

“If we teach them to use AI, aren't we just making it easier for them to avoid learning?”

This is the right question — and the tension at the heart of this whole session. The answer is: it depends on how we teach it. Teaching avoidance leaves students without skills they will need. Teaching uncritical use accelerates dependence. Teaching intentional, reflective use — with the THINK–USE–REFLECT framework embedded in practice — develops both the skill and the judgment to use it well. That is the goal.

“This feels like a lot of extra work on top of an already packed curriculum.”

Acknowledge this is real. Two reframes: (1) Much of this is not additional content — it is a new lens on existing work. The AI or Me? activity can replace a conversation you were already having about sources and research. The reflection log replaces or supplements existing metacognitive tools. (2) The investment now in building these habits means less time spent managing AI misuse issues later.

Differentiation During the Workshop

Elementary teachers

- Focus on CA1 and CA5 as the highest-value activities for their context
- Ensure they leave with the elementary reflection log
- Pair with a colleague from the same grade band during activity workshop
- The modelling protocol is particularly important — young students are highly influenced by what they see teachers do

High school teachers

- Likely to have the most pressing concerns about academic integrity — honour this without letting it dominate
- CA3 (The Transparency Conversation) is especially high-value for their context
- Encourage them to involve students in writing the agreement — student voice is particularly powerful at this level
- The high school reflection log includes an integrity statement — discuss how this might sit within their school's existing academic integrity framework

Follow-Through & Platform Connection

30-Day Commitment Options

Implement one activity: Run one of the five classroom activities (CA1–CA5) with your class within the next four weeks. Bring a brief note on what happened to the next PD session.

Launch the agreement: Facilitate the classroom AI agreement process (CA5) with your class and post the final version on your classroom wall or learning platform.

Introduce the log: Introduce the THINK–USE–REFLECT log with your students for one assignment and reflect on what you noticed about their engagement.

Connection to xvalidateai.com Platform

Completed classroom AI agreements can be uploaded to the school's xvalidateai dashboard as part of the school's AI governance record, demonstrating that student-facing AI literacy has been addressed. Reflection logs and activity completion can also be logged as evidence of AI readiness professional development. Schools building a bank of shared classroom activities can contribute adapted versions to the platform's resource library.

Related Modules in the PD Series

Recommended before this session

- 1.1 AI Self-Literacy Assessment

Recommended after this session

- 2.3 AI Prompt Literacy for Teachers

- 1.2 How AI Actually Works — A Practical Primer
- 2.1 Designing AI-Resilient Assessments

- 3.1 AI Incident Identification & Reporting
- 3.2 Bias, Fairness & AI in Education
- 4.1 Building Your School AI Policy

TIP

This session is most effective when delivered after Module 2.1 (Designing AI-Resilient Assessments). Teachers who have already thought about how to design tasks for AI-present classrooms arrive at this session better positioned to think about student-facing instruction — they have already shifted from ‘how do we stop AI’ to ‘how do we work with it responsibly.’
